                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel tumour-associated antigen, designated B345 which has cytostatic activity. B345 is involved in communication, interaction and/or signal transduction with extracellular components and ligands, especially in the metastatic potential of cancers, particularly of the colon. B345 or its immunogenic fragments, also the DNA that encodes it, are useful for immunotherapy of cancer, particularly carcinoma of lung or colon. Antibodies raised against B345 are useful for treatment and diagnosis of cancers that are associated with B345 expression, including their use for targeted delivery of cytotoxic or radioactive agents. Probes derived from B345 can be used to detect tumour-specific modulators. This sequence, and can be used to screen for B345 specific modulators. This sequence encodes a human B345 tumour-associated antigen described in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
This invention describes a novel tumour-associated antigen, designated B345 which has cytostatic activity. B345 is involved in communication, interaction and/or signal transduction with extracellular components and ligands, especially in the metastatic potential of cancers, particularly of the colon. B345 or its immunogenic fragments, also the DNA that encodes it, are useful for immunotherapy of cancer, particularly carcinoma of lung or colon. Antibodies raised against B345 are useful for treatment and diagnosis of cancers that are associated with B345 expression, including their use for targeted delivery of cytotoxic or radioactive agents. Probes derived from B345 can be used to detect tumour-specific modulators. This sequence, and can be used to screen for B345 specific modulators. This sequence encodes a human B345 tumour-associated antigen described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                    3'UTR

```
CC the 5602 nucleotide comprises at least 15 nucleotides; or the complementary to the comprises at least 15 nucleotides; or the complementary to the comprises at least 15 nucleotides; or the complementary to the comprises a 5'-end cc complementary strand of a polynucleotide which comprises a 5'-end cc polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence, where the coligonucleotide comprises a 3'-end sequence, where the cc oligonucleotide comprises at least 15 nucleotides and the combination of ct for 5'-end sequence/3'-end sequence is selected from those defined in cc the specification. The primer sets can be used in antisense therapy and cf in gene therapy. The primers are useful for synthesising polynucleotides, cc particularly full-length cDNAs. The primers are also useful for the cettion and/or diagnosis of the abnormality of the proteins encoded by cc the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CAAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAH3633 represent human amino acid sequences; and AAH13629 to AAH13632 crepresent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   comprises: (a) an oligo-dT primer and an oligonucle to the complementary strand of a polynucleotide which 5602 nucleotide sequences defined in the specific oligonucleotide comprises at a complementary strand of a polynucleotide which 5602 nucleotide sequences defined in the specific oligonucleotide comprises at a complementary strand of the specific of an artificial sequences are comprised as a comprise of an artificial sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim

Sequences AAS63145-AAS63223 represent DNA encoding purified secretory CC polypeptides of the invention. The polypeptides and polynucleotides can be used in the treatment, prevention and diagnosis of diseases associated CC with inappropriate secretory protein expression. These diseases include CC cell proliferative disorders such as atherosclerosis and psoriasis, CC cancers such as leukaemia and melanoma, immune system disorders such as casthma and diabetes mellitus, neurological disorders such as epilepsy and CC parkinson's disease, mental disorders such as schizophrenia and seasonal CC lateral sclerosis, demyelinating disorders such as amyotrophic CC lateral sclerosis, demyelinating disorders such as multiple sclerosis, central nervous system disorders such as multiple sclerosis, CC neurofibromatosis and neuromuscular disorders such as cerebral palsy and CC neurofibromatosis and neuromuscular disorders such as cerebral palsy and CC neurofibromatosis and neuromuscular disorders such as mental retardation and CC muscular dystrophy. Target polynucleotides in a sample can be detected by hybridising the sample with a probe sequence complementary to the target CC polynucleotide, under conditions in which a hybridisation complex is CC polypeptides may also be used as antigens in the production of antibodies against secretory proteins and in assays to identify modulators of CC against secretory proteins and in assays to identify modulators of complex in expression and activity. The antibodies may also be used as cCC invention in samples e.g. by enzyme linked immunosorbent assay (ELISA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Panzer SR, Spiro PA, Banville SC, Shah P, Chalup MS, Char Chen A, D'sa SA, Amshey S, Dahl CR, Dam TC, Daniels SE; Dufour GE, Flores V, Fong WT, Greenawalt LB, Hillman JL, Liu TF, Roseberry AM, Rosen BH, Russo FD, Stockdreher TK, Wright RJ, Yap PE, Yu JY, Bradley DL, Bratcher SR, Chen Wichen HJ, Hodgson DM, Lincoln SE;

```
The polynucleotide sequences given in AAA26346 to AAA26458 encode the CC human secreted proteins given in AAY91451 to AAY91691. The human secreted CC proteins can have activities based on the tissues and cells they are CC expressed in Examples of the activities are: Cytostatic; antiallergic; osteopathic; antiarthritic; antibacterial; antidiabetic; cantialthma; antipsoriatic; and cardiant. The polynucleotides and their corresponding secreted proteins are useful for preventing, treating or cameliorating medical conditions, e.g. by protein or gene therapy. Also cc pathological conditions can be diagnosed by determining the amount of the polynucleotides. Specific uses are described for each of the cc polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cc cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, cc altergies, Alzheimer's and behavioural disorders, schizophrenia, cc ardiovascular disorders, reproductive disorders, schizophrenia, cc cardiovascular disorders, reproductive disorders, gastrointestinal cord disorders, respiratory disorders and metabolic disorders. The proteins care also useful for identifying their binding partners. Cc AAA26337 to AAA26345 and AAY91450 are sequences used in the exemplification of the present invention.

```
AAS21244-AAS21518 encode for novel human secretory and transmembrane CC PRO polypeptides. The PRO polypeptides are useful to detect other CC PRO polypeptides, to link bioactive molecules to cells expressing CC PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. CC Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the cartilage, the proliferentiation of chondrocytes, the proliferation or CC gene expression in pericyte cells, the release of proteoglycans from CC artilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood CC monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide CC factor VIIA. The PRO polypeptides can be used in assays to identify collecules involved in binding interactions. The polynocleotides encoding PRO polypeptides can be used in gene therapy.

(I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated nucleic acid molecule associated with cancerous state prostate cells and correlating with presence of prostate cancer, used for detecting presence of prostate cancer, stage of prostate cancer
                                                                                                                                                                                                                                                                             Sequence 1031
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end sequence complementary to a CC polynucleotide which comprises a 3'-end sequence complementary to a CC polynucleotide comprises a 3'-end sequence, where the CC the 5'-end sequence?'3'-end sequence is selected from those defined in CC the 5'-end sequence?'3'-end sequence is selected from those defined in CC the 5'-end sequence?'3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers allow obtaining of the full-length CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAH35631 to AAH13742 represent human cDNA sequences; and AAH13629 to AAH13622 cof the present oligonucleotides, all of which are used in the exemplification cof of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

portions of proteins which are associated with human colon tumours.

The invention also specifically discloses 8 human colon tumour proteins (AAB11897-B11904). The nucleic acids, the polypeptides they encode, and antigen presenting cells (APCs, preferably dendritic cells) expressing such polypeptides may be used in vaccines that target tumour cells, especially colon tumour cells, thereby inhibiting the development of cancer. T-cells specific for the polypeptide expressed by the APC are used to remove tumour cells from biological samples, especially blood or fractions thereof. The sample or the isolated T-cells specific for the polypeptide can then be used to inhibit cancer development. CD4 + and/or CD8+ T-cells from a patient may be incubated with a polypeptide or nucleic acid of the invention, or an APC expressing such a polypeptide, to cause the proliferation of specific T-cells. The T-cells can be cloned and then administered back to the patient to inhibit cancer
                                                                                                                                                                                                                                                                                                                                                                                           23-DEC-1998;

Nucleic acids encoding the polypeptides and antibodies against the polypeptides may be used to determine the expression level of a tumour protein of the invention, and therefore to determine whether cancer cells are present. Such diagnostic methods may also be used to monitor the progression of a cancer by repeating the processes at time intervals, and comparing the current result to previous results. The present sequence represents a cDNA encoding a human colon tumour

                                             CC associated with inappropriate colon tumour associated protein (TCAP)
CC expression, such as colonic cancer. For example, (I) and (II) may be
CC used to treat disorders associated with decreased expression by
CC rectifying mutations or deletions in a patient's genome that affect the
CC activity of TCAPs by expressing inactive proteins or to supplement the
CC produce the TCAP proteins, by inserting the nucleic acids into a host
CC complementary sequences may also be used as DNA probes in diagnostic
CC complementary sequences may also be used as DNA probes in diagnostic
CC quantitate the presence of similar nucleic acids in samples, and
CC therefore which patients may be in need of restorative therapy. (I) may
CC and in assays to identify modulators of TCAP expression and activity.
CC Anti-(I) antibodies and antagonists may also be used to down regulate
CC (e.g. by enzyme linked immunosorbant assay (ELISA)). AA128460 to AAN29512
CC and AAM24494 to AAM24523 represent nucleotide and amino acid sequences
CC given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      15-FEB-2000;

                                                         Th present invention relates to the isolation of novel cDNA sequences encoding for at least an immunogenic portion of human colon tumour proteins. The sequences of the invention are useful in pharmaceutical compositions and vaccines for the prevention and treatment of cancers such as colon cancer. They are also useful for the diagnosis and monitoring of such cancers. Antibodies to the colon tumour proteins and antigen presenting cells that express polynucleotides encoding colon tumour proteins can be used to inhibit the development of cancers. T-cells that react specifically with colon tumour proteins are useful for removing tumour cells from samples (e.g. blood) and for cancer treatment. The polynucleotides sequences are also useful ir gene therapy. AAS57325-AAS5880 represent the cDNA sequences of the invention that encode for portions of human colon tumour proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 4; Page 266; 299pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and antigen presenting cells that express polynucleotides encoding colon tumour proteins can be used to inhibit the development of cancers. T-cells that react specifically with colon tumour proteins are useful for removing tumour cells from samples (e.g. blood) and for cancer treatment. The polynucleotides sequences are also useful gene therapy. AAS57325-AAS58880 represent the cDNA sequences of the invention that encode for portions of human colon tumour proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             encoding for at least an immunogenic portion of human colon tumour proteins. The sequences of the invention are useful in pharmaceutical compositions and vaccines for the prevention and treatment of cancers such as colon cancer. They are also useful for the diagnosis and monitoring of such cancers. Antibodies to the colon tumour proteins
                                                                                                                                                                                                                                                                                                                                                                               3308

The present invention describes primer sets for synthesising 5602 cc full-length cDNAs defined in the specification. Where a primer set cc comprises: (a) an oligo-dr primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of cc the 5602 nucleotide sequences defined in the specification, where the cc oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises as sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end cc polynucleotide which comprises a 5'-end cc polynucleotide which comprises a 3'-end sequence complementary to a complementary and complementary complementary and complementary. The primers selected from those defined in the specification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and camplementary without any specialised methods. AAH03166 to AAH13628 and complementary and complementary and complementary conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-JAN-2000;

The cDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of

                                                                                                                   밁
                                                                                                                                              ş
                                                                                                                                                                              밁
                                                                                                                                                                                                                                      망
                                                                                                                                                                                                                                                                 δÃ
                                                                                                                                                                                                                                                                                                                                                            CC polypertide (II) sequences. (I) is useful as hybridisation probes, complymerase chain reaction (PCR) primers, oligomers, and for chromosome cand gene mapping, and in recombinant production of (II). The polypucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques compared to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical comparing of sites expressing (II). (I) and (II) are useful for treating the compared of the polypeptide and polynucleotide expression or biological activity. The polypeptide and polynucleotide sequences have applications in constitutions for diagnostics, forensics, gene mapping, identification of mutations cand to produce other types of data and products dependent on DNA and cand to produce other types of data and products dependent on DNA and cand of the sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed cant for the pipe, intronibilities and not printed on the pipe.
                                                                                                                                                                                                                                                                                                                 Query Match

B345 is involved in communication, interaction and/or signal transduction with extracellular components and ligands, especially in the metastatic potential of cancers, particularly of the colon. B345 or its immunogenic fragments, also the DNA that encodes it, are useful for immunotherapy of cancer, particularly carcinoma of lung or colon. Antibodies raised against B345 are useful for treatment and diagnosis of cancers that are associated with B345 expression, including their use for targeted delivery of cytotoxic or radioactive agents. Probes derived from B345 can be used to detect tumour-specific modulators. This sequence, and can be used to screen for B345 specific modulators. This sequence represents a human B345 tumour-associated antigen described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                              immunosuppressive; antiHIV; antiHiflammatory; nootropic; neuroprotective; antiallergic; osteopathic; antiArthritic; antibacterial; antidiabetic; antiasthma; antipsoriatic; and cardiant. The polynucleotides and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions on be diagnosed by determining the amount of the proteins in a sample or by determining the presence of mutations in the polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, hepatic and renal disease, schizophrenia, anticities and behavioural disorders, schizophrenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           30-JUL-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                            The polynucleotide sequences given in AAA26346 to AAA26458 encode human secreted proteins given in AAY91451 to AAY91691. The human s proteins can have activities based on the tissues and cells they a expressed in Examples of the activities are: cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; secreted protein; diagnosis; cytostatic; immunosuppressive; antiHIV; antiinflammatory; nootropic; neuroprotective; antiallergic; osteopathic; antiarthritic; antibacterial; antidiabetic; antiasthma;

The proteins or polynucleotides can also be used as food additives or preservatives. The proteins are also useful for identifying their binding partners. AAA26337 to AAA26345 and AAY91450 are sequences used in the exemplification of the present invention.
 Tumour-associated antigen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel tumour-associated antigen, designated B345 which has cytostatic activity. B345 is involved in communication, interaction and/or signal transduction with extracellular components and ligands, especially in the metastatic potential of cancers, particularly of the colon. B345 or its immunogenic fragments, also the DNA that encodes it, are useful for immunotherapy of cancer, particularly carcinoma of lung or colon. Antibodies raised against B345 are useful for treatment and diagnosis of cancers that are associated with B345 expression, including their use for targeted delivery of cytotoxic or radioactive agents. Probes derived from B345 can be used to detect tumour-specific modulators. This sequence, and can be used to screen for B345 specific modulators. This sequence represents a human B345 tumour-associated antigen described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-JUL-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence, where the polynucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAB95893 represent human cDNAs sequences; AAB92446 to CC CAB95893 represent human amino acid sequences; AAB9246 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The polynucleotide sequences given in AAA26458 encode the C. human secreted proteins given in AAA2451 to AAA26458. The human secreted proteins given in AAA29451 to AAA26459. The human secreted contains can have activities based on the tissues and cells they are expressed in Examples of the activities are: cytostatic; antiallargic; osteopathic; antiarthrith; antibacterial; antidiabetic; antialsthma; antipsoriatic; and cardiant. The polynucleotides and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also compations in a sample or by determining the presence of mutations in the polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, allergies, Alzheimer's and behavioural disorders, schizophrenia, cardiovascular disorders, reproductive disorders, schizophrenia, cardiovascular disorders, reproductive disorders, gastrointestinal cord clasorders, respiratory disorders, spinal cord injuries, transplant rejection, diabetes, asthma, sepsis, acne, psoriasis, can also be used as food additives or preservatives. The proteins are also useful for identifying their binding partners. Capacition of the preservatives. Capacition of the preservatives.

                                                                                                                                                                                                                                                                                                                                                        Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ANUI2172-ANUI2446 represent novel human secretory and transmembrane CC PRO polypeptides. The PRO polypeptides are useful to detect other CC PRO polypeptides, to link bloactive molecules to cells expressing CC PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, recttal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. CC some of the 275 sequences are also useful to stimulate the release of cumour necrosis factor-alpha (TNF-alpha) from human blood, the CC proliferation or differentiation of chondrocytes, the proliferation or CC gene expression in pericyte cells, the release of proteoglycans from CC artilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by Skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide CC molecules involved in binding interactions. The polynucleotides encoding CC PRO polypeptides can be used to generate probes, antisense RNA/DNA, CC transgenic or knock out animals and can be used in gene therapy.

                                              The polynucleotide sequences given in AAA26458 encode the CC proteins can have activities based on the tissues and cells they are CC proteins can have activities based on the tissues and cells they are CC expressed in Examples of the activities are: cytostatic; antiallergic; osteopathic; antiarthritic; antibacterial; antidiabetic; cantiasthma; antipsoriatic; and cardiant. The polynucleotides and their corresponding secreted proteins are useful for preventing, treating or cameliorating medical conditions, e.g. by protein or gene therapy. Also cc pathological conditions, e.g. by protein or gene therapy. Also cc pathological conditions, e.g. by protein or gene therapy. Also cc pathological conditions can be diagnosed by determining the amount of the polynucleotides. Specific uses are described for each of the cc polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cc cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, developmental abnormalities can feetal deficiencies, blood disorders, developmental abnormalities consteoporosis, arithritis, infections, AlDS, spinal cord injuries, cc ardiovascular disorders, reproductive disorders, schizophrenia, cc cardiovascular disorders, reproductive disorders, gastrointestinal cd disorders, respiratory disorders and metabolic disorders. The proteins craft in proteins are also useful for identifying their binding partners.

CC AAA26337 to AAA26345 and AAY91450 are sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-JUL-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                       CC polypeptide (II) sequences. (I) is useful as hybridisation probes, colypnerase chain reaction (PCR) primers, oligomers, and for chromosome cc and gene mapping, and in recombinant production of (II). The cc and gene mapping, and in recombinant production of (II). The cc and gene mapping, and in recombinant production of (II). The cc and gene mapping, and in recombinant production of (II). The cc and activity of (II) is useful in gene therapy techniques cc (II). (II) is useful for generating antibodies against it, detecting or cc quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical cc imaging of sites expressing (II). (I) and (II) are useful for treating cc disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in creating creations for genetic disorders or other traits to assess biodiversity and creating creating and creating contract dependent or now and and creating contract dependent or now and and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a

                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; purified secretory polypeptide; cell proliferative disorder; cancer; immune system disorder; neurological disorder; mental disorder; motor neuron disorder; demyelinating disorder; neuromuscular disorder; central nervous system disorder; enzyme linked immunosorbent assay; ELISA; gene therapy.
         Sequences AAU69432-AAU69511 represent purified secretory polypeptides of the invention. The polypeptides and their associated polynucleotides can be used in the treatment, prevention and diagnosis of diseases associated the inappropriate secretory protein expression. These diseases include reliferative disorders such as atherosclerosis and psoriasis,
                                                                                                                                                                                                                 Chen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neurofibromatosis and neuromuscular disorders such as cerebral palsy and muscular dystrophy. Target polynucleotides in a sample can be detected by hybridising the sample with a probe sequence complementary to the target polynucleotide, under conditions in which a hybridisation complex is formed, and detecting the presence or absence of the complex. The polypeptides may also be used as antigens in the production of antibodies against secretory proteins and in assays to identify modulators of protein expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the sequences of the invention in samples e.g. by enzyme linked immunosorbent assay (ELISA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          asthma and diabetes mellitus, neurological disorders such as epilepsy an Parkinson's disease, mental disorders such as schizophrenia and seasonal affective disorder (SAD), motor neuron disorders such as amyotrophic lateral sclerosis, demyelinating disorders such as multiple sclerosis, central nervous system disorders such as mental retardation and

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially
                                                                                                                                                                                                               Nucleic acids encoding useful for preventing, metastasis -
